JUST ENERGY TRANSITION SKILLING FOR EMPLOYMENT PROGRAMME (JET SEP)

Strategic Intervention Factsheet: Nation-wide Renewable Energy In-service Training Programme

Scaling in-service training opportunities and equipping the system to continuously be able to bridge critical Renewable Energy skills gap through:

Reducing the time, effort and financial burden on companies to host interns, and support them to effectively embed into their day-to-day activities

Adapting curricula to focus on transferable skills across the RE value chain; embed practices to support curricula to adjust to future needs of the industry

Anchoring the 'when', 'who' and 'where' of training on demand-led, place-based, year-by-year skills forecasts across renewable and adjacent sectors

South Africa's starting point

There is a growing need for skilled renewable energy workers, with up to 63k jobs possible by 2030; but industry is concerned about finding the right talent

In-service training opportunities bridge skills gaps as needed by industry, giving graduates an entry point into employment and displaced workers opportunities to transition

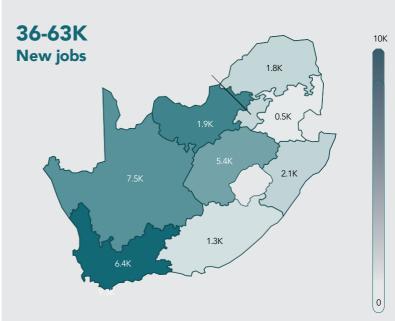

However, opportunities are limited as companies hesitate to host interns given the significant time, effort and financial investment required

Scaling these opportunities is critical to create a demand-driven talent pipeline that can shift to meet the evolving needs of South Africa's Just Energy Transition

Nation-wide job creation for key job families in Solar, Wind and BESS projects by 2030

Existing programmes provide useful starting points but often lack scale required to meet the full demand

50 interns (2025)

Lighthouse example:
South African Wind Energy Association
Wind Industry Internship Programme is
an 8-month internship where interns
receive work-readiness training before
placement at a member organizations

JET SEP's Nation-wide Renewable
Energy In-service Training Programme
to place 500-1K graduates and displaced
workers in demand-led renewable energy
in-service training opportunities over the
next year, and scale up in line with industry
demand

Key next steps:

Co-create an industry-informed pre-placement training curriculum of transferrable soft and technical skills

Centralize applications and placements to facilitate demandled matching of applicants

and hosts

Support host companies in effectively structuring in-service training to be mutually beneficial

Establish a mechanism to capture feedback from participants and hosts to continuously refine programme

As of March 2025

This intervention is a catalyst to realise 3 critical paradigm shifts required to drive system-level transformation

Demonstrating a private-sector-led model by lowering barriers for companies to host and co-fund in-service training while also showcasing direct benefits (talent pipeline, public recognition etc.,) that encourage broader adoption

Testing an agile, demand-led approach by aligning training with real job needs using place-based, year-by-year modeling to set the right skills, pace, and scale, enabling a smoother intern-to-employee transition while providing a replicable structure for other programmes

Coordinating funding streams to jointly launch and refine the programme, then transition it into stable homes (e.g., SETAs), shaping new public–private financing models for workforce development

Support required for implementation

Host companies willing to integrate interns into real-world work, provide mentorship, and offer structured feedback

Funding partners to support curriculum development, training logistics, and participant stipends for scale and sustainability

Technical expertise to shape workplacereadiness curricula and ensure internships are effectively structured
